EXP 14	Pro-Code Extension Using Zoho Catalyst

AIM

To study the integration of Zoho Catalyst with the Hotel Room Booking application to extend its functionality using custom code and backend services.

THEORY

Zoho Catalyst is a pro-code development platform that enables developers to build and deploy backend services, APIs, and serverless functions.

Key features include:

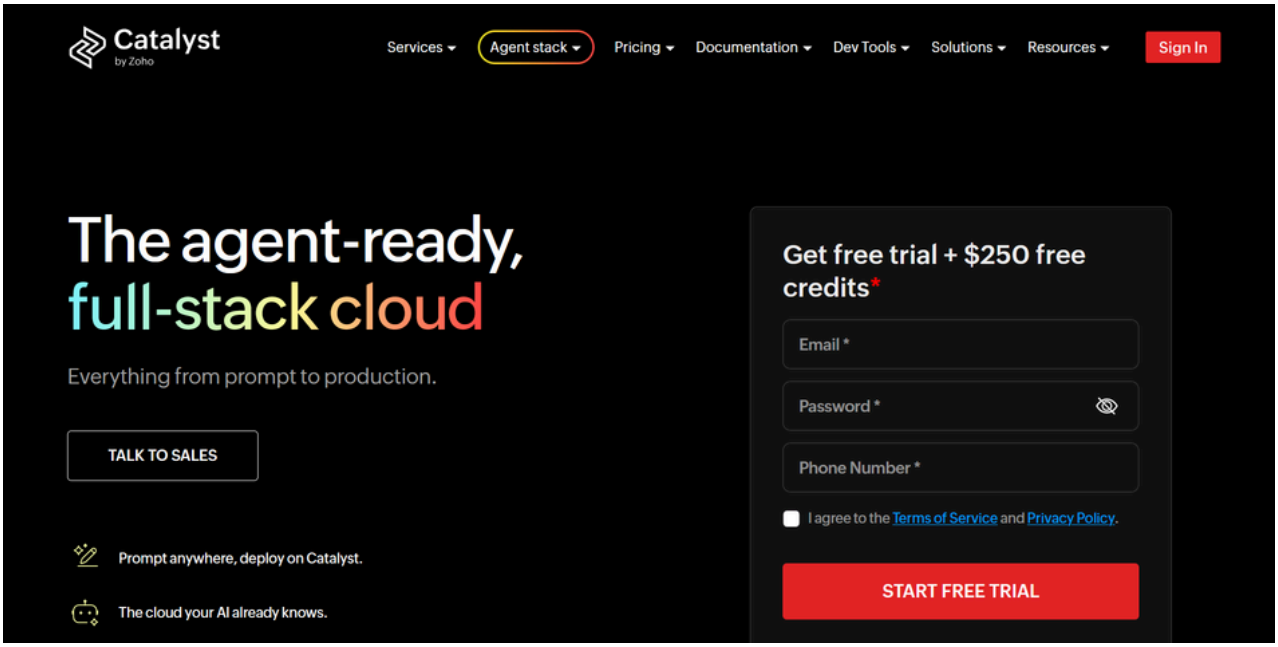

- Serverless Functions: Execute custom logic for booking management and validation.
- API Integration: Connect Zoho Creator with external services through APIs.
- Data Processing: Process booking records and calculate room charges.
- Automation: Extend existing workflows with custom backend logic.
- Scalability: Support application functionality through cloud-based services.

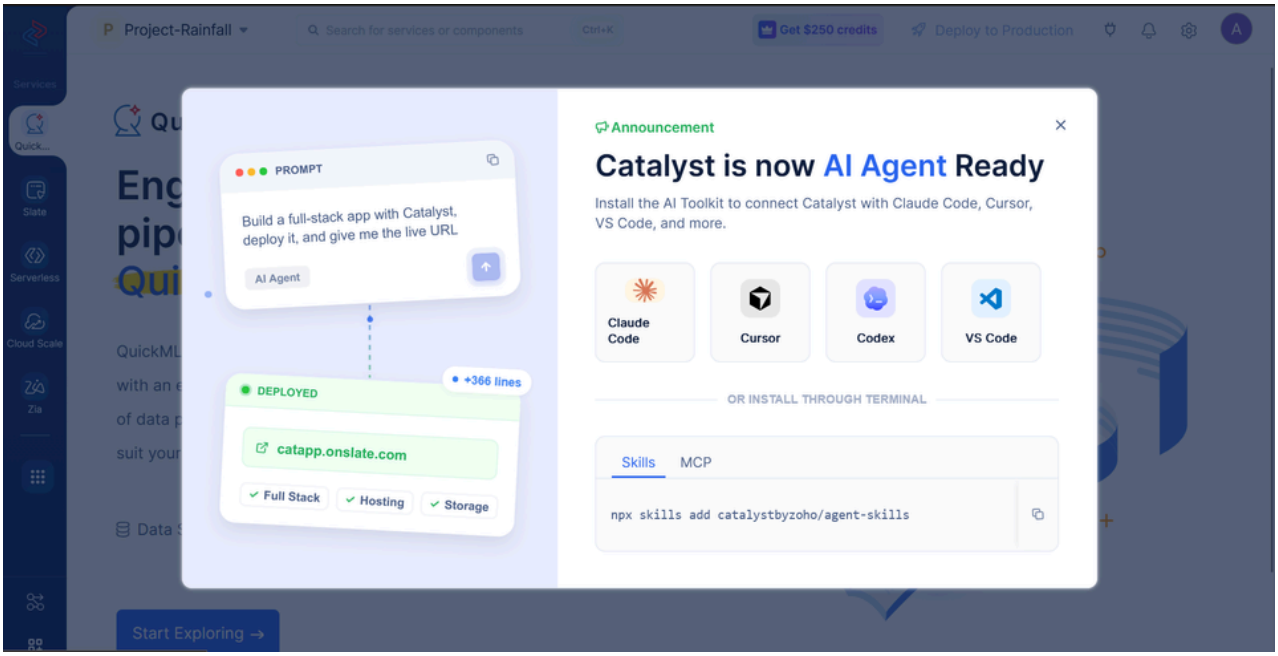

PROCEDURE

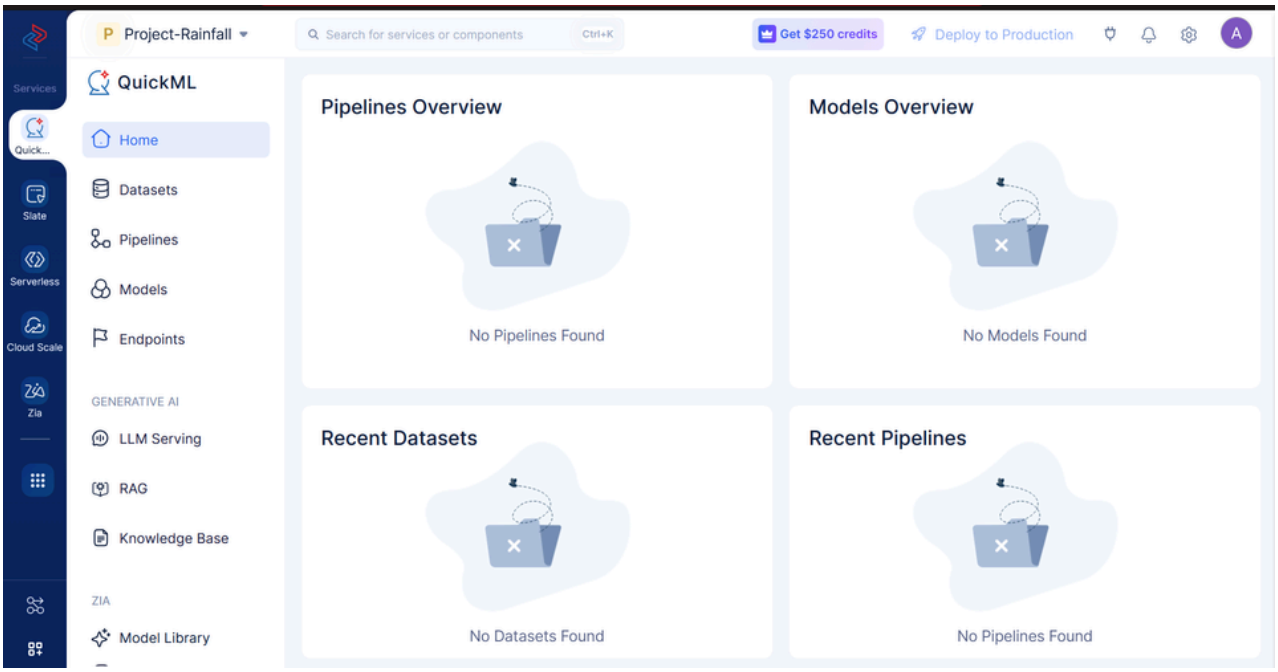

1. Logged in to the Zoho Catalyst platform.
2. Created a new project named Hotel Booking Extension.
3. Explored the available development options and backend services.
4. Created a serverless function to process hotel booking information.
5. Implemented custom logic to validate booking details and calculate the total room charges.
6. Configured the function to receive booking data through an API request.
7. Tested the function using sample hotel booking records.
8. Verified the function response and checked the processed booking details.

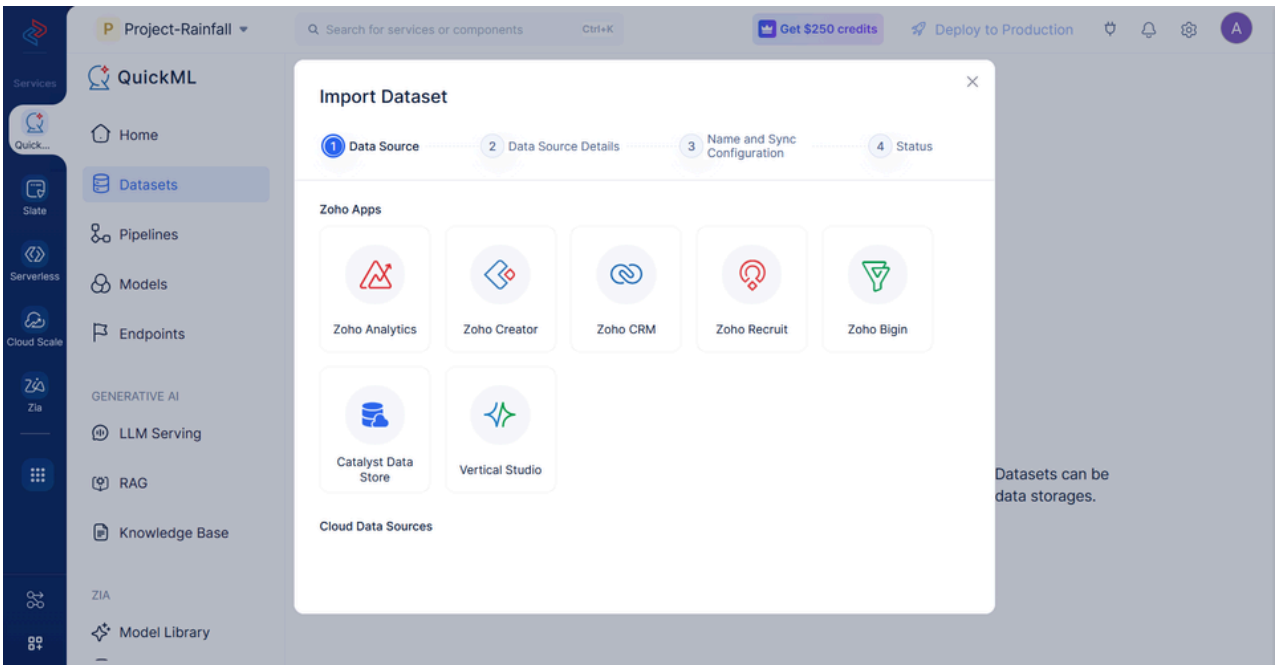

APPLICATION

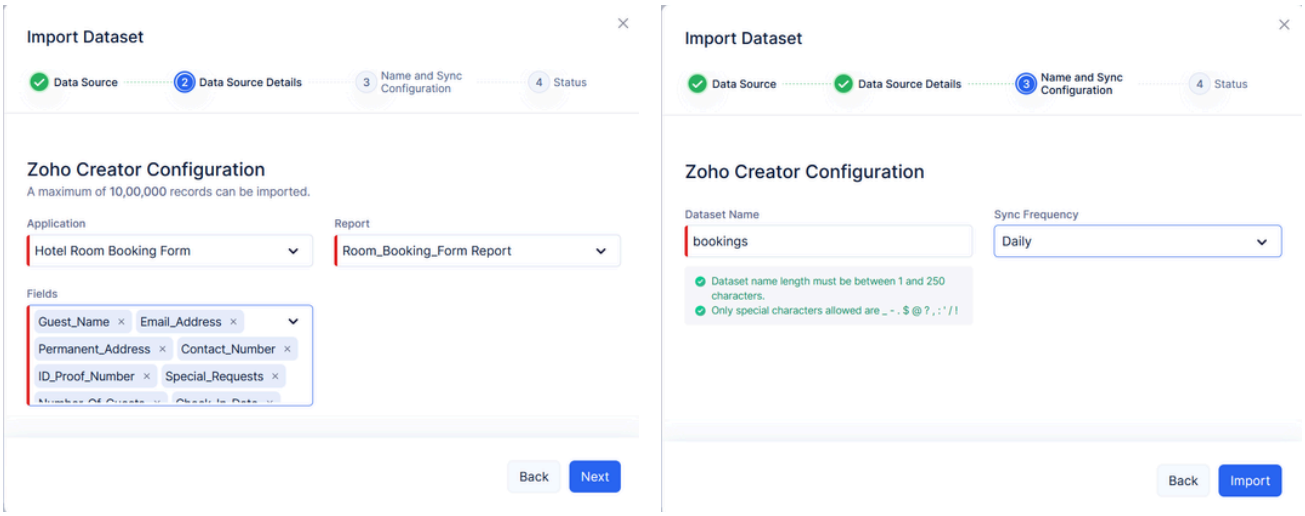

In the Hotel Room Booking application, Zoho Catalyst can extend backend functionality by validating reservations, calculating booking amounts, checking room availability, and integrating external services through APIs.

CONCLUSION

Thus, the pro-code extension capabilities of Zoho Catalyst were studied for the Hotel Room Booking application. Custom backend functions and API integration can extend the application's functionality beyond standard low-code features.
