EXP 7	Zoho Creator API Integration

AIM

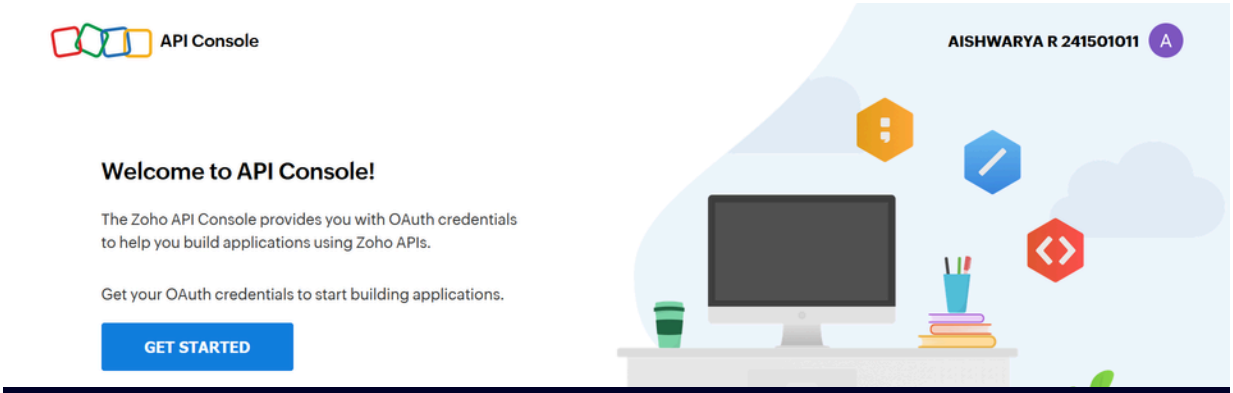

To integrate the Hotel Room Booking application in Zoho Creator with Postman using REST APIs and OAuth 2.0 authentication to retrieve booking records.

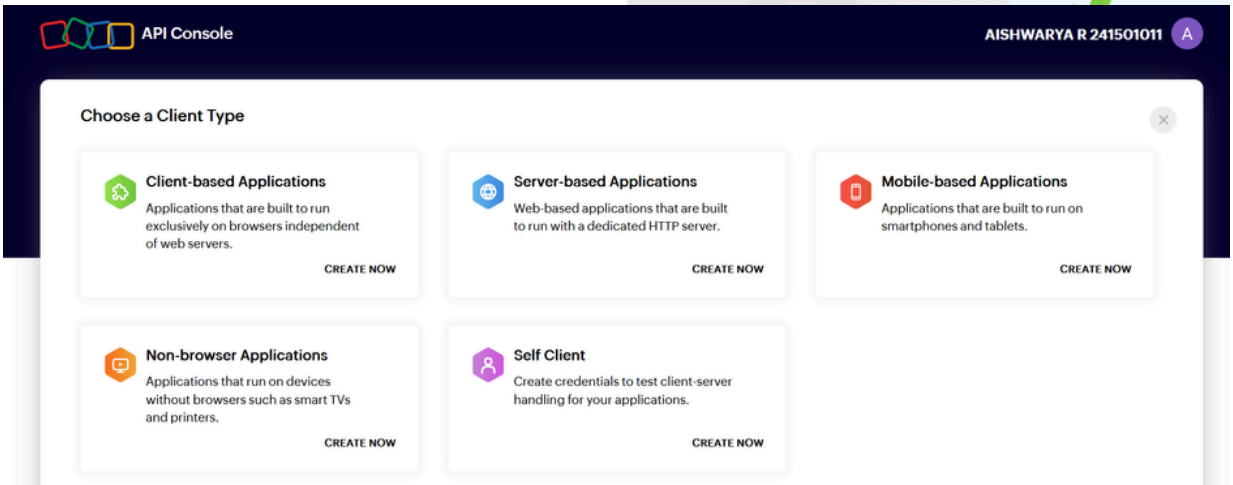

SOFTWARE REQUIRED

- Zoho Creator
- Postman
- Zoho API Console

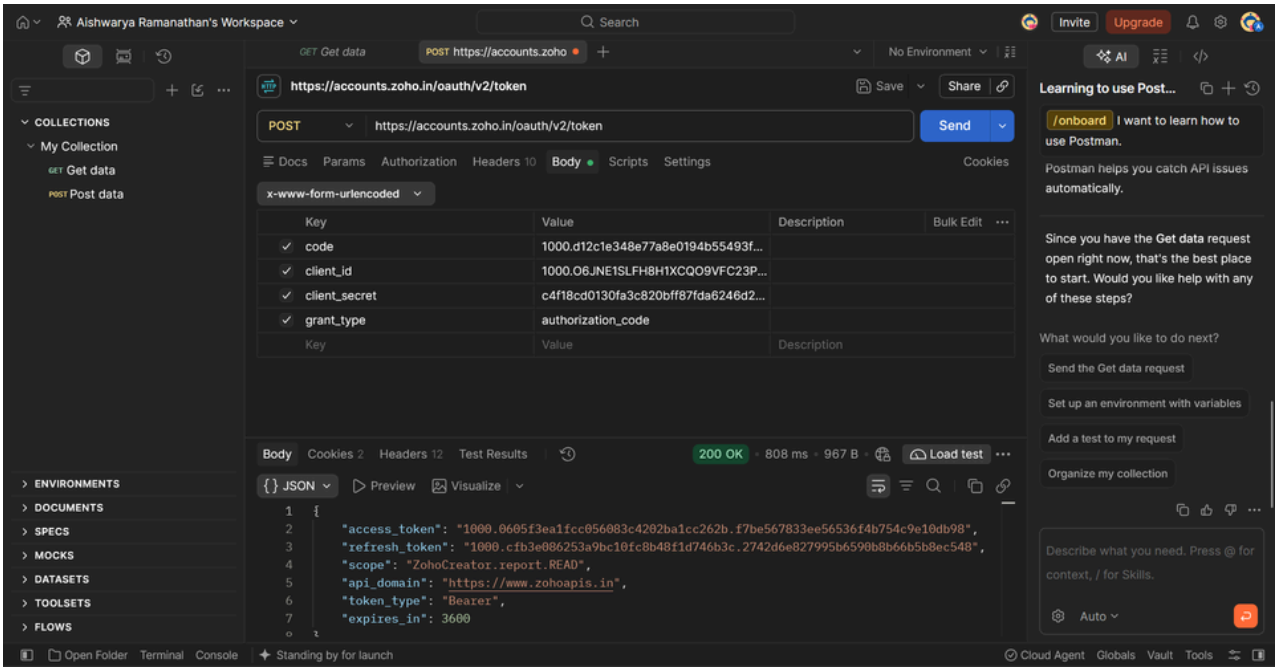

PROCEDURE

1. Created a Self Client in the Zoho API Console.
2. Generated an authorization code using the required scope ZohoCreator.report.READ.
3. Exchanged the authorization code for an access token using a POST request to the Zoho OAuth token endpoint.
4. Created a GET request in Postman using the Zoho Creator API endpoint for the Room_Booking_Report.
5. Configured Bearer Token authentication using the generated access token.
6. Sent the GET request to retrieve booking records from Zoho Creator.
7. Verified the HTTP response status and inspected the returned JSON data.
8. Compared the retrieved booking records with those displayed in the Zoho Creator report.

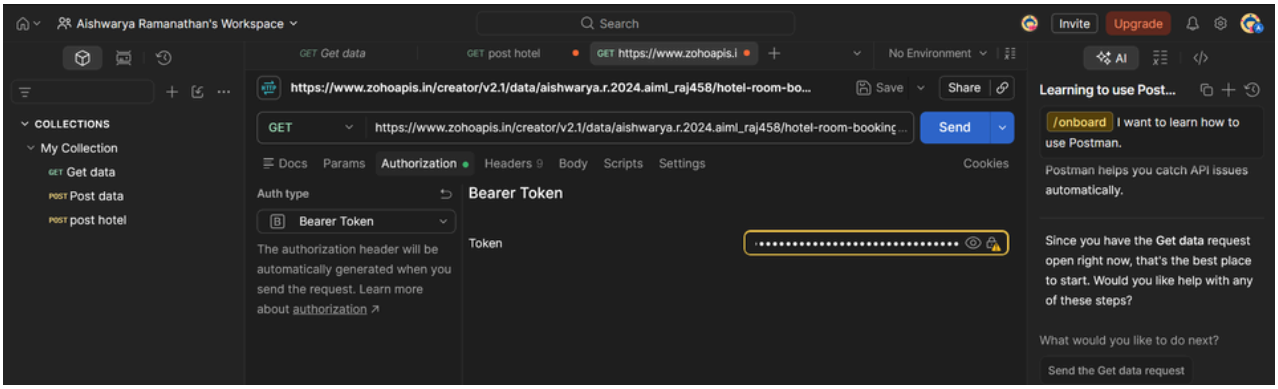

OBSERVATION

The GET API request returned an HTTP 200 OK status. The JSON response contained hotel room booking details, confirming successful data retrieval from Zoho Creator.

VERIFICATION

Postman: Verified the retrieved booking records in the JSON response.

Zoho Creator: Compared the API response records with those available in the Room_Booking_Report to confirm successful data retrieval.

CONCLUSION

Thus, Zoho Creator API integration with Postman was successfully performed using OAuth 2.0 authentication, and hotel room booking records were retrieved through the GET API.
