EXP 11	Application Deployment and Migration

AIM

To study the deployment and migration of the Hotel Room Booking application in Zoho Creator to make it accessible to users and understand the process of transferring applications between environments.

THEORY

Application deployment in Zoho Creator involves publishing an application for users to access and use. Migration involves transferring an application and its configuration from one environment or account to another.

Key features include:

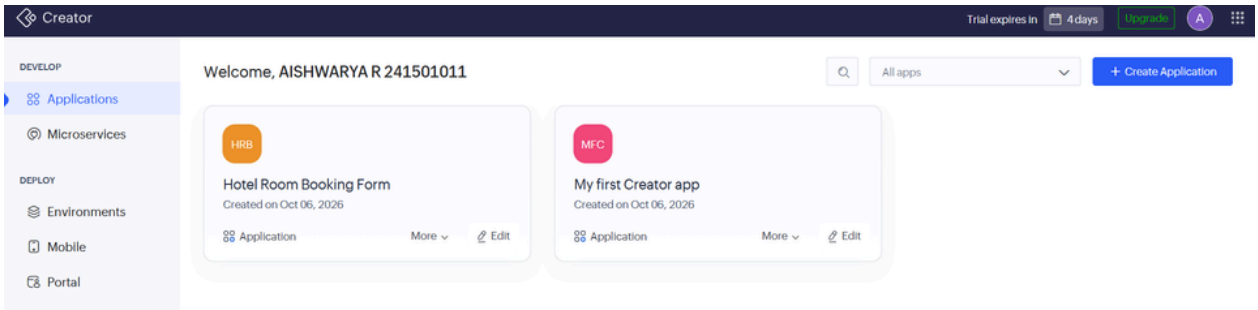

- Application Deployment: Makes the application available to authorized users.
- Application Export: Exports the application structure and configuration.
- Application Import: Imports an exported application into another environment.
- User Access Management: Controls access to deployed applications based on permissions.
- Testing and Validation: Ensures that forms, reports, workflows, and pages function correctly after deployment or migration.

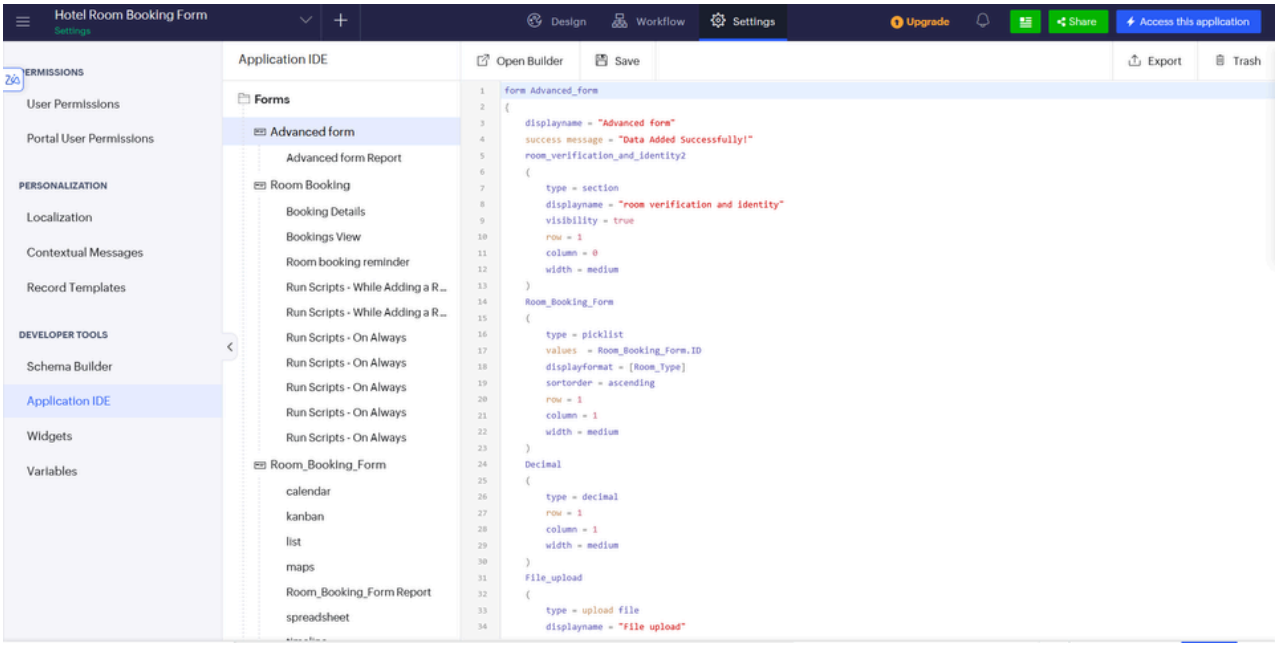

PROCEDURE

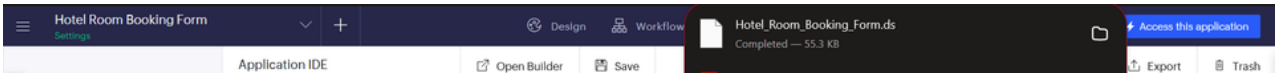

1. Logged in to Zoho Creator and opened the Hotel Room Booking application.
2. Reviewed the application's forms, reports, pages, and workflows.
3. Explored the application settings and available deployment options.
4. Examined the export options to understand how the application structure can be transferred.
5. Explored the import process for migrating an application into another environment.
6. Reviewed the user permissions and access settings for the application.
7. Verified the application's components and functionality after the available deployment or migration steps.

APPLICATION

In the Hotel Room Booking application, deployment enables authorized hotel staff to manage reservations, check-in/check-out operations, and booking reports. Migration helps transfer the application configuration when moving to another account or environment.

CONCLUSION

Thus, the application deployment and migration features of Zoho Creator were studied for the Hotel Room Booking application, including application transfer, access management, and post-migration verification.
